

Swing Carriages

Swing Carriage - The load capacity of a lift truck jib has a maximum of approximately 1935 pounds to 6000 pounds on either the retracted or extended positions range. You may need to check with a material handling specialist concerning the particular limits of your forklift application. The load capacity rankings are intended for the jib itself and not the lift truck or the utmost load that can be carried safely utilizing a certain lift truck. It is important to bear in mind that at any time when any accessories like for example a lift truck jib are added to the lift truck, the new center of gravity created by the accessory would lessen the general lift capacity of the forklift. There are directions available which offer details on the way to properly estimate these load limits.

Before making use of a lift truck jib, make certain that it is well secured to the lift truck with the use of shackles and hooks. Constantly make sure so as to verify that the screw pins are tight. It is vital to even make sure that the load calculations have been made correctly. Bear in mind to take into consideration the fact that rated capacities at times lessen when the boom is in an elevated position, every time the boom is extended with telehandlers or each time the mast is tilted frontward.

Vital pointers each time you are using an adjustable jib is to never pull a load with this particular type of accessory. These types of accessories are really just used for vertical raising. Also, avoid letting the load move to and fro. Utilize extreme caution each and every time a load is carried to be able to avoid tipping over the truck.
