

Grapples for Forklifts

Forklift Grapples - Grapples work along with the crowning operation of the bucket cylinder positioned on the excavator. They can mount directly onto the jib or any quick hitch that is in bucket position. Grapples are most often meant for the processing and handling of timber, construction materials, domestic and aggregate waste items. The grapple's boxed design has added support bridging. This manufactured design provides the grapple with maximum support and strength by means of stopping the body from breaking and rotating throughout its operation.

All of the moving parts that encompass the grapple, including the toes, are made out of hardened steel. The revolving points have been particularly designed in order to ensure supreme closing force and holding ability. The operator has the capacity to handle different sizes and varieties of materials using the jaws fitted at the end part of the grapple with toes. This can enable the jaws to be able to close through one another in a finger configuration for utmost handling capacity.
